AB The photopolymerizable composition comprises radically polymerizable compds. and a photopolymn. initiator, wherein the polymerization initiator is a borate compound represented by $(R_1R_2R_3R_4B-)nZm+X-(m-n)$ (R_1-4 = alkyl, aryl, heterocyclyl, silyl; $Mm+$ = cationic polymer; $X-(m-n)$ = anion; m, n = integer). The recording material comprising the photopolymerizable composition and color components are also claimed. The use of the photopolymerizable composition in the recording material provided high sensitivity, good dye bleaching property, and excellent storage stability.

Section cross-reference(s): 75

AB Photoinduced in-plane alignments of nematic liquid crystal (LC) mols., 5CB,
have been investigated in a LC cell prepared with alternate self-assembled
films of polyelectrolytes and low-mol.-weight azobenzene mols. on gold
electrodes using the attenuated total reflection (ATR) measurement method.
A high dichroism of the self-assembled film was observed with the irradiation

of

linearly polarized light. The ATR properties due to excitations of
surface plasmon polaritons (SPP) were observed in the LC cell and changed
with the irradiation of linearly polarized visible light to the LC cell. The
exptl. results corresponded well with the calculated shifts at different
orientation states of 5CB mols. It was estimated that the LC mols. have
in-plane alignments and that the LC mols. are oriented perpendicular to
the polarization direction of the irradiated visible light. The mol.
orientations could be controlled by the polarization direction of
irradiated light on the hybrid LC cell. In-situ observations for the cell
were also carried out during the irradiation. Furthermore, the thickness and
dielec. consts. of the self-assembled films were evaluated using the ATR
method.

 AB Photoinduced surface relief gratings of alternate layer-by-layer self-assembled films containing azobenzene **dyes** were fabricated. The alignment properties of nematic liquid crystal (LC) mols. on these films were studied in a hybrid LC cell configuration. Poly(diallyldimethylammonium chloride) (PDADMAC) and Direct Red 80 (DR80, azobenzene **dye**) were deposited using the alternate layer-by-layer self-assembly method. The gratings of the PDADMAC/DR80 films were fabricated by exposure to interference patterns of Ar⁺ laser light at 488 nm. The formation of the gratings on the films was observed using atomic force microscopy. Also, the alignment properties of LC mols., 5CB, on the films were studied by monitoring the change in birefringence of the LC cell in situ. This in-plane alignment was observed after .apprx.30 min exposure with the laser, simultaneous with the formation of the interference patterns.

CC 66-1 (Surface Chemistry and Colloids)
Section cross-reference(s): 41, 74
AB Structural changes of the Langmuir-Blodgett (LB) films of azobenzene accompanied by photoisomerization are described. First, photoisomerization is explained in terms of 'free volume'. In the polyion complex monolayers of amphiphiles having 2 azobenzene units at the air-water interface, the area per mol. depends on the polycation species. The fraction of cis-azobenzene in the LB films at the photostationary state under the illumination with UV light increased with increasing area per mol., which is consistent with the concept of free volume. Second, a counter example of the concept of free volume is presented. 3D cone-shaped structures developed with trans-to-cis photoisomerization in the polyion complex LB film of a water-soluble amphiphilic azobenzene. These structures appeared and disappeared reversibly by alternate illumination with UV and visible light. The 2D LB film structure exerts significant modification by photoisomerization. This is against the concept of free volume because this concept does not consider the possibility that the 2D LB film structures may change into three-dimensional ones. Photo-induced J-aggregate formation of non-photochromic and photochromic dyes is described. Two cyanine dyes were each mixed with an amphiphilic azobenzene in the LB films. These cyanine dyes are

known to form J-aggregates in single-component LB films. In the mixed LB films, the J-aggregate formation was suppressed to some extent. The alternate illumination of the films with UV and visible light caused the photoisomerization of azobenzene in the mixed LB films, which triggered the J-aggregate formation of the cyanine **dyes**. The J-aggregate formation was accompanied by the development of 3D cone-shaped structures from the film surface. When an amphiphilic merocyanine was mixed with the azobenzene in the LB films, J-aggregate formation was also induced by the alternate illumination with UV and visible light. This J-aggregate formation was also accompanied by a large morphol. change: circular domains changed into fractal-like ones. The J-aggregate formation of the **dyes** and the concomitant morphol. change were irreversible. In these cases, the photoisomerization of azobenzene served as a trigger to induce self-organization of the **dye** mols.

AB Surface relief gratings (SRGs) were fabricated on composite films assembled by alternate electrostatic deposition of a polyelectrolyte, poly(dimethyldiallylammonium chloride), and an organic azo dye, Congo red. The modulation of SRGs was found to increase with the thickness of the matrix films. Significant photochem. bleaching of the azo dye in the polymeric microenvironment as well as gradient-force-induced migration of the small azo dye contributes to the formation of the SRG structure. This finding demonstrates a facile method to fabricate SRGs for optical and information storage applications using com. available azo dyes and polyelectrolytes.

AB Powdered peroxy or peroxo compds. for **hair** bleaches are wetted with an aqueous solution of a polyfunctional olefin monomer and dried to provide a polymeric coating on the particles for dust control. The treatment, which requires only very small amts. of monomer, also has an antistatic effect. The peroxy or peroxo compound itself may act as polymerization initiator.

Thus,

200 g K peroxomonosulfate triple salt (2KHSO₅.KHSO₄.K₂SO₄) with a dust content of 2.26% was sprayed with 4 g 50% aqueous dimethyldiallylammonium chloride solution (containing 2 mol% methyltriallylammonium chloride as crosslinking agent and 0.1 g Na peroxodisulfate as supplementary initiator); polymerization occurred during drying in air.

AB Title fibers comprise a copolymer content of 5-15 weight% of an ester component and 0.6-1.4 weight% (meth)allylsulfonate and a film-forming coating comprising a polymeric pyrrolidinium salt 4-12, ethoxylated alkylammonium betaine 4-13, alkylbis(polyoxyethylene)ammoniumsulfobetaine sulfinate or sulfobetainesulfonate 4-7, nonionic surfactant 1-5, low mol. weight alc. or glycol 5-10, foam inhibitor 0.05-2, film-forming assistants 0.05-2, and water to 100 weight%. The fibers are readily incorporated in hydraulic binders, e.g. plaster, mortar, and concrete, have a good bond to the material, and produce good composite. An acrylonitrile-Me acrylate-sodium allylsulfonate copolymer (93.00:5.92:1.08) fiber was prepared, treated in an aqueous bath containing dimethyldiallylammonium chloride-sulfur dioxide copolymer,

hexadecyl/octadecylbis(polyoxyethylene)-3-sulfopropylammonium betaine, hexadecyl/octadecylbis(polyoxyethylene)-2-sulfinato-3-sulfopropylammonium betaine, hexadecyl/octadecylbis(polyoxyethylene)carboxymethylammonium betaine, ethoxylated C9-18 alcs, chain-cleaved di-Me **siloxane**, and a mixture of triethoxysilylpropylamine and the alcoholysis product of a chain cleaved di-Me **siloxane**, and are easily incorporated into a

I

II

- AB Photog. materials having improved antistatic characteristics contain in an antihalation layer, interlayer, or top layer a homo- or copolymer having repeating units with a quaternary ammonium structure of the formula I (R-R3 = H or C1-6 alkyl; R4, R5 = C1-18 alkyl; X- = halide, NO3-, OH-, HSO4-, SO42-, n = 100-600) as the antistatic agent. The antistatic agent, which has no adverse effects on the phys.-mech. properties of the photog., can contain a vinyl compound, such as acrylic acid, arylamide, arylonitrile, diacetoneacrylamide, or vinylpyrrolidone, as the comonomer. Thus, a color photog. material carrying an antihalation back layer containing the polymer II, the polymeric acid HO2C(CH2CMePh)CO2H, and a triphenylmethane dye showed a surface resistance of $5.2 \times 10^6 \Omega$ and excellent antistatic characteristics.

AB Almost all conventional acid filter **dyes** can be rendered nondiffusing in emulsion or thin auxiliary layers, without lowering their phys.-mech. properties or interference with their bleachability or washing-out during processing by a small amount of a mordant (I; R₁, R₂ = C₁-4 alkyl; n = 300-600; and X⁻ = anion). Added as storable 5-10% solution they have a low water absorption and have little effect on the viscosity of gelatin coatings. Thus, 2 solns. were made both containing gelatin 100 and a pentamethine **dye** 8, and as mordant solution A an imide of maleic anhydride interpolymers of US 3,048,487 (CA 59; 7726b) 4 g, and solution B I (R₁, R₂ = Me, n = 300, X = Cl⁻) 4.15 g. A Yielded a 2.3μ filter layer having an optical d. of 1.09, and B one of 2.0μ and 0.98, resp. The water absorption of the layers was 4.1 and 3.0 g H₂O/m², and the **dye** diffusion after 2 wet contacts with a layer of unhardened gelatin 43 and 2% (as optical d.), resp.

AB A method for permanently **dyeing** hair which comprises subjecting said hair to a number of treatments, having a set time interval between each two consecutive such treatments, wherein each treatment comprises steps (a) and (b) below: (a) contacting said hair, for a period of about 5 s to about 5 min with a recently made mixture of: (i) part (ai) **dye** intermediates in water at alkaline pH with quaternary ammonium compds.; (ii) part (aii) an oxidizing compound such as hydrogen peroxide in water at acidic pH; (b) rinsing said mixture from said hair with water; and wherein said number of treatments is between about 2 to about 30; and wherein said set time interval between each two consecutive treatments is between about 8 h and 30 days. A two part formulation of a hair **dye** according to above method is disclosed.

AB The invention concerns the use of nitrogen-containing polysiloxanes , polystyrene sulfonate and pyrrolidone as color protection agents in hair preps.; preferred component is amodimethicone. Other ingredients are natural or synthetic cationic polymers, anionic polymers, protein hydrolyzates, cationic surfactants, and vitamins. Thus a shampoo contained (weight/weight%): Flexan 130 1.0; paraffin oil 3.0; Lanette O 3.0; Foryl 100 0.2; Cutina CP 0.8; beeswax 0.05; PHB methylester 0.2; PHB ethylester 0.1; phenoxyethanol 0.6; Dehyquart A-CA 3.0; glucose 5.0; chamomile extract 0.6; Culminal MHPC 20.0; perfume 0.15; water to 100; pH ca. 3.5.

PRAI	JP 2001-298321		20010927		

AB The invention relates to an oxidative hair **dye** or hair bleach composition consisting of alkali-containing 1st agent and oxidizing agent-containing

2nd agent for use by mixing together just before the application, wherein the 1st and/or 2nd agent contains (1) a sucrose fatty acid ester and (2) poly(dimethylmethylenepiperidinium chloride), dimethyldiallylammonium chloride-acrylamide copolymer and/or dimethyldiallylammonium chloride-acrylic acid copolymer. The hair composition of the present invention provides smooth and shiny hair. A hair bleach 1st agent containing ammonia solution (28%) 2, monoethanolamine (80%) 6, starch syrup 1.2, lanolin fatty acid aminopropylethyldimethylammonium ethylsulfate 0.5, polyoxyethylene octyl dodecyl ether 10, polyoxyethylene alkyl ethers 15, ethanol 15, anhydrous sodium sulfite 0.5, 0.5, ethylenediaminehydroxyethyltriacetate sodium salt monohydrate 0.5, fragrance q.s., and water balance to 100 %, and a 2nd agent containing H2O2 (35%) 17, cetanol 2, polyoxyethylene stearyl ether 0.4, sucrose stearate 2, dimethyldiallylammonium chloride-acrylic acid copolymer 0.5, **dimethylpolysiloxane** 1, stearyltrimethylammonium chloride 0.5, phenacetin 0.1, phosphoric acid q.s., to pH 3.5, and water balance to 100 % were formulated.

OS MARPAT 138:242890

AB The present invention is a controlled delivery system that can be incorporated in hair, skin, and fabric care products such as shampoos, conditioners, hair styling products, lotions, creams, liquid laundry detergents, fabric softener, and other hair, skin, and fabric care products to effectively deliver a broad range of active agents and sensory markers onto the hair, skin, and fabric. The system also prolongs the release rate of the active agents or sensory markers over an extended period of time, or provides heat triggered release of the active agents and yields a high impact fragrance "burst" upon blow drying the hair, ironing the fabric, or other types of heat treatment. The controlled delivery system of the present invention is a nano-sphere, having an average sphere diameter of from about 0.01 μ to about 10 μ . The nano-sphere comprises hydrophobic materials, cationic conditioning agent or, cationic conditioning agent in conjunction with a cationic charge booster to assist in adhering the spheres onto hair, skin, and fabric. The invention further relates to a controlled delivery system where the release rate of the active ingredients is synchronized with that of a sensory marker to convey to the consumer the product performance. Nanosphere delivery systems for skin were prepared comprising water 60, Retinol 10, Incroquat Behenyl HE 10, and Performa V-216 20%.

AB The present invention is a controlled delivery system that can be incorporated in hair care products such as shampoos, conditioners, hair styling products, and other hair care products to effectively deliver a broad range of active agents and sensory markers, such as fragrances or cooling agents onto the hair. The system also prolongs the release rate of the active agents or sensory markers over an extended period of time, or provides heat triggered release of the active agents and yields a high impact fragrance "burst" upon blow drying the hair or other types of heat treatment. The controlled delivery system of the present invention is a nanoparticle, having an average particle diameter of from about 0.01 μ to about 10 μ . The nanoparticle comprises hydrophobic polymers and copolymers, cationic charge boosters in conjunction with cationic surface-active conditioning agents that assist in adhering the particles onto hair. The invention further relates to a controlled delivery system where the release rate of the active ingredients is synchronized with that of a sensory marker to convey to the consumer the product performance. For example, nanoparticles were prepared from 68.9% water, 15% polyethylene, 15% fragrance, 1% Incroquat Behenyl HE, and 0.1% Lupasol PR 815. The nanoparticles obtained were incorporated into a hair conditioner base; they deposit and adhere onto hair and are not washed off during the rinse process.

AB The invention concerns a composition for treating keratinous materials, in particular hair, comprising, in a physiolo. and in particular cosmetically acceptable medium, at least a protecting and conditioning agent, and addnl. at least a cationic poly(alkyl) vinyl lactam polymer. Said combinations enable to improve deposition of the agent protecting or conditioning the keratinous materials and the cosmetic properties. A shampoo contained ethoxylated sodium lauryl sulfate 17, 30% cocoyl betaine 2.5, Polymer ACP-1234 (a quaternary ammonium acrylic polymer) 1, copra acid monoisopropanolamide 0.6, Uvinul MS40 0.1, perfume, preservatives and water q.s 100 g.

AB	The invention concerns hair dyes that contain direct dyes , long-chain quaternary ammonium compds., cationic polymers, nonionic, amphoteric or zwitterionic polymers, ethanol, propanol or isopropanol and water. The dyes are packaged in a transparent container. Thus a dye contained (weight/weight%): dimethicone copolyol 1.50; cetrimonium chloride 0.80; ethanol 15.00; polyvinylpyrrolidone 0.50; propylene carbonate 15.00; lactic acid (90%) 5.00; sodium hydroxide (32%) 0.20; polyquaternium 6 0.60; quaternary dimethylaminoethylmethacrylate homopolymer 3.50; Acid Orange 7 0.15; Acid Yellow 3 0.10; Acid Violet 43 0.25; water to 100.

AB	The invention concerns novel cosmetic compns. comprising in a cosmetically acceptable medium at least a silicone comprising at least a terminal or pendant monovalent polyoxyalkylene group and at least an (AB) _n type				

silicone, A being a block **polysiloxane** and B a polyoxyalkylene block and n being not less than 2. Said combination provides enhanced cosmetic properties (lightness, combing, volume, luster). Said compns. are used in particular for washing and/or conditioning keratinous materials such as the hair or the skin. A shampoo contained ethoxylated sodium lauryl sulfate 14, Miranol C2M 3.6, Jaguar C13A 0.04, polyoxyethylene **polydimethylsiloxane** 3, polyethylene glycol distearate 1, citric acid q.s. pH = 6.5, perfume, preservatives, and water q.s. 100 g.

AB The invention concerns a composition for treating keratinous fibers, in particular human keratinous fibers such as hair, comprising in a physiologically acceptable medium, at least a protecting or conditioning agent, and further at least a cationic associative polyurethane polymer. The invention also concerns **dyeing** methods and devices using said composition. A shampoo contained ethoxylated sodium lauryl sulfate 17, 30% cocoylbetaine 2.5, cationic polymer 1.0, copra acid monisiopropanolamide 2-hydroxy-4-methoxybenzophenone-5-sulfonic acid, perfume and preservatives q.s., and water q.s. 100 g.

AB	The invention concerns hair conditioners that are packaged in pressure-tight transparent containers and are composed of two clear phases; the hydrophilic phase contains water, water-miscible solvents, a cationic hair conditioner, and an organic or inorg. salt; the lipophilic phase includes the liquified propellant. Upon usage the two phases are mixed and sprayed as a foam. Thus an aerosol foam composition contained (g): polyvinylpyrrolidone 0.2; polyquaternium-11 0.18; Cetyltrimethyl ammonium chloride 0.25; quaternium-80 0.45; magnesium sulfate heptahydrate 0.2; isodecane 2.5; isobutane 6.8; butane 6.8; propane 1.8; water to 100.

AB An oxidation-type hair bleach or **dye** which is composed of a first lotion containing an alkali agent and a second lotion containing an oxidizing agent, contains the following components (A), (B), (C), and (D) in amts. described below based on the whole of the mixture of the first lotion with the second one, and has a pH of 8 to 12: (A) 8-40 % a water-compatible organic solvent exhibiting an octanol-water partition coefficient (logP) of 0.3 or

above at 25°C and having a mol. weight of ≤ 200 , (B) 0.1-10 % an alkali agent, (C) 0.1-12 % an oxidizing agent, hydrogen peroxide, and (D) 25-70 % water. This hair bleach or **dye** has a high bleaching power, can **dye** the hair in a good bright color, and is lowered in the irritant stench and the irritation to the scalp. A hair bleach comprised (1) a first lotion containing Na polyoxyethylene lauryl sulfate 15, coco fatty acid diethanolamide 40, benzyl alc. 25, ammonia water (28 %) 7, and water 13 % and (2) a second lotion containing Na polyoxyethylene lauryl sulfate 20, coco fatty acid diethanolamide 2, H₂O₂ solution (35 %) 17, phosphoric acid solution (75 %) 0.3, and water 60.7 %.

AB Phase-separated rinse-off hair coloring/cleansing compns. comprise water soluble

dye materials, surfactant materials, and water, wherein the water soluble **dyes** are concentrated in a dispersed phase of liquid emulsion droplets dispersed within the droplets to the extent that the intensity of the color imparted by the **dye** materials to the droplets is greater than the intensity of the color imparted by the **dye** materials to continuous aqueous phase. The dispersed phase may be formed by the combination of the surfactant materials and the **dye** materials. Methods of coloring and cleansing hair are also disclosed. Thus, a shampoo contained sodium lauroamphoacetate 16, and Basic Blue Number 99 3% and water qs.

	WO 1999-FR114	W	19990120		
AB	The invention concerns an ammonia-free composition for dyeing hair fibers, comprising an oxidant compound, dye precursors and a non-volatile odorless alkaline agent characterized in that it further comprises: a quaternized copolymer of dimethyldiallylammonium and acrylic acid; a quaternized silicone; an acrylic-itaconic copolymer esterified with 1 or several fatty alcs., optionally polyoxyethylenated. Thus, a gel contained Merquat-280 0.8, Abil Quat-3272 0.1, EtOH 14.4, Ethomeen-T012 14.0, monoethanolamine 11.5, Dehyton K-COS 12.0, white olein 8.0, Masquol P-550 1.0, Dowanol-PM 5.0, 35% Na bisulfite 1.5 p-phenylenediamine 1.5, p-aminophenol 0.25, hydrquinone 0.15, resorcinol 0.35, m-aminophenol 0.06, m-phenylenediamine 0.035, p-amino-o-cresol 0.0015, 1-phenyl-3-methyl-5-pyrazolone 0.2. and water to 100%. A second composition contained Na pyrophosphate 0.01, sodium stannate 0.02, Masquol 0.15, Structure-2001 0.40, Structure-3001 0.92, 50% oxygenated water 12.0, 85% orthophosphoric acid 0.1, and water 100%. The 2 compns. were mixed and used for hair prepsns.

- AB Novel compns. containing in a cosmetically acceptable medium at least one conditioning agent selected among poly- α -olefins, fluorinated oils, fluorinated waxes, fluorinated gums, carboxylic acid esters, cationic polymers, silicon insol. in the medium, mineral, vegetable or animal oils and at least one (AB)_n type polyoxyalkylene amine silicon, A being a **polysiloxane** block and B being a polyoxyalkylene block comprising at least an amine group. Said combination provides cosmetic properties (smoothness, softness) greatly improved compared to the properties obtained by one or the other of the constituents used on its own. Said compns. are used for washing and/ conditioning hair. A shampoo contained sodium lauryl ether sulfate 17, Dehyton AB30 3, amine polyoxyalkylene silicon block (Silsoft A843) 1.5, Jaguar C13S 0.5, copra acid monoisopropanolamide 2, sodium hydroxide q.s. pH = 8.5, and water q.s. 100 g.

OS	MARPAT 129:235420				
AB	A method for treating hair keratin fibers to provide them with new appropriate properties, comprising the following steps: reducing the sulfur bonds of hair keratin to generate, only at the surface of the fibers at a depth less than 10 μ m reactive sites and in fixing covalently on said reactive sites at least one active compound for providing the hair keratin fibers with new appropriate properties, said active compound containing at least a reactive function capable of reacting with said reactive sites formed at the keratin fiber surface. This method is applicable to the treatment of fibrous or non-fibrous keratin substances of human or animal origin. A lotion containing tris(2-carboxyethyl)phosphine 14.23, hydroxyethyl cellulose 1.00, 20% ammonia q.s. pH = 6, water and 100.00 g was applied on a gray hair for 5 min., then the hair was rinsed followed by application of a composition containing Procion Yellow MX-8G 0.01, Procion Red MX5B 0.01, Lanazol blue 3G 0.01, hydroxyethyl cellulose 1.00, lactic acid q.s. pH = 4, and water q.s. 100.00 g. The hair was then washed, shampooed, and dried. The yellowish shade of the hair was completely removed.

AB The title cosmetic contains ≥ 1 poly(oxazoline) derivs.
 $[N(COR)CH_2CH_2]_n$ (I; R = alkyl, n = polymeric) with mol. weight $> 10,000$, and
 ≥ 1 cationic polymers. The cationic polymer may be selected from
 quaternized polymers or **polysiloxanes**, poly(amines),
 poly(aminoamides), or quaternary polyammonium compds. This cosmetic
 composition is useful for the conditioning treatment of hair following a hair
 waving procedure, **dyeing**, or shampooing; I are capable of
 imparting body and bounce to the hair, but only in combination with
 cationic polymers are shine, manageability, and softness imparted
 satisfactorily. A wave setting lotion contained I (R = Et) (polymer XAS
 10874-03) 0.6, Gaffix VC 713 (cationic terpolymer) 0.5, H₂O 100 g, and
 sufficient EtOH, 2-amino-2-methyl-1-propanol, perfume, color and
 preservative.

AB The title agents are made of alkali metal or alkanolamine salts of C12-18 fatty acids, a cationic or amphoteric silicone polymer (Ucan Silicone Ale 56, Abil 9950, etc.), a cationic surfactant (Noramium M2CD, Argust 2HT75, Ammonyx 4002, etc.), an alkalizing agent, and a cationic polymer. The cationic polymer is a quaternary polyammonium polymer, vinylpyrrolidone dialkylaminoalkyl(meth)acrylate copolymer (eventually quaternized), poly(methacrylamidopropyltrimethylammonium chloride), and cationic proteins and polyaminoamides, eventually cross-linked or alkylated. The agents are mixed with an oxidant, shortly before use. For **dyeing**, the agents are also mixed with oxidative **dye** precursors and, eventually, coupling and reducing agents. The above agents have a good foaming capacity and are readily dispersed in the hair. They improve the cosmetic properties of the hair, especially the combing capacity, and impart a silky look. A hair **dye** comprised oleic acid 10.4, triethanol amine 5.44, Mirapol A15 0.1, ceraphyl 60 0.1, cationic emulsion Q.2.7224 0.5, 35% NaHSO3 solution 1.3, penta-Na diethylenetriaminepentaacetate 2.4, p-phenylenediamine 0.027, resorcinol 0.033, m-aminophenol 0.030, hydroquinone 0.15, 20% NH3 10, and H2O to 100 parts by weight Before use, the **dye** (100 g) is mixed with 100 g 6% H2O2.

AB Compns. for treating hair consist of a mixture of polymers with cationic groups and anionic polymers which contain the group CH₂CH(SO₃M) (where M = H, NH₂, alkali or alkaline earth metal), surfactants and other additives. The combination of cationic polymers with vinylsulfonate polymers leads to a better disentanglement of hair than that containing other sulfonic polymers. Thus, a shampoo composition was prepared containing Na poly(vinylsulfonate) [25053-27-4] 1, Cartaretin F8 [61840-27-5] 6, Dehyton AB 30 6, surfactant RCH(OH)CH₂O[CH₂CH(OH)CH₂O]_nH (R = C₉-12 alkyl and n = 3.5) 5, Antarox CO 630 5 g, NaOH to pH 7, perfume, preservative, **dye** and H₂O to 100 g. This composition is applied to the hair where a smooth foam is formed. The hair is then washed and the damp hair can be disentagled easily. If Na poly(styrenesulfonate) is used instead of Na poly(vinylsulfonate) the disentanglement of hair is difficult.
